QUICKSTART GUIDE

Thank you for testing out ZONA. Hardware only gets truly great when it lands in hands like yours.

By exploring its limits, pushing the workflow, and sharing what works (and what does not), you are directly shaping the final device. Your feedback makes it possible to turn ZONA into our most responsive, reliable module yet.

Plug it in, build your setups, and let us know where it shines and where it needs refinement.

We appreciate your time, ears, and honest input.

PLUG IN

Plug ZONA in via USB-C. Class-compliant connection.

CONFIGURE

Use the brand new HANGAR Sandbox mode to configure ZONA on a beginner friendly user interface. If you are comfortable with lua coding, head to Grid Editor and customize it to its core.

CONTROL

Control your DAW of choice, your MIDI capable instruments & visuals.

WHAT IS IT?

Without touching it the surface is blank by design. If you slide your finger across the pad a COMET follows your finger leaving a trail disappearing after a while. Every sweep across the dual-axis broadcasts fluid CC messages to whatever parameters you want to control. Think of it like physically sculpting values.

WHEN TO USE?

Whenever two parameters need to move together instead of in isolation: morphing synth's filter cutoff alongside its wavetable drive, blending dry audio into reverb trails during live builds, or performing cinematic strings by steering modulation and expression with a single gesture.

HOW TO MAP?

Calmly but with attention. Move your finger vertically to map the Y axis and horizontally to map the X axis. ZONA's XY uses an advanced axis mapping feature built into this configuration, so you don't have to spend ages accidentally triggering both axes at once during setup.

WHAT IS IT?

The surface splits into four independent vertical touch strips, spaced out cleanly across the surface. Tap anywhere along a column to jump instantly to a value, or slide smoothly to ride the level up and down. Clear LED meter columns light up beneath your touch, giving you immediate visual feedback on where each channel stands. Full MIDI RX implementation lets your DAW send values back to ZONA, essentially giving you the behavior of motorized faders as lights snap to current project levels and follow automations seamlessly.

WHEN TO USE?

Whenever you need direct, multi-channel hands-on control without reaching for mechanical knobs or faders. It fits four-track volume leveling, dedicated wet/dry sends on multiple return tracks, envelope shaping across attack, decay, sustain, and release, or steering four macro controls across your live set simultaneously. Bidirectional feedback also makes it ideal for jumping between DAW tracks without parameter jumps.

HOW TO MAP?

One strip at a time. Enable MIDI output from your DAW track back to ZONA so incoming CC updates illuminate the strips dynamically.

WHAT IS IT?

ZONA becomes a dedicated touch trackpad for your computer. Glide a single finger across the surface to guide your pointer smoothly, tap once for left click, tap with two fingers for an instant right click, and slide two fingers up or down to scroll through documents and arrangements.

WHEN TO USE?

Whenever you need fast desktop navigation directly from your controller setup without reaching for a physical mouse. It keeps you locked into your creative workflow during editing sessions, whether you are scrolling along extensive timelines in your DAW or video editor, clicking contextual menus, or browsing plugin presets.

HOW TO MAP?

Plug and play out of the box. Because this configuration outputs native mouse and pointer HID commands rather than standard MIDI CCs, your operating system recognizes it immediately.

WHAT IS IT?

A modular configuration application hosted inside the currently pre-release version [HANGAR](#) web app. SANDBOX lets you build and define ZONA's touch surface piece by piece, dropping elements onto the pad and tuning their behavior individually to shape a completely custom interface.

WHEN TO USE?

Whenever pre-made layouts do not match your exact setup, use HANGAR to design hybrid control schemes from scratch, like placing an XY pad alongside discrete touch faders, splitting zones for different channels, or engineering bespoke performance layouts tailored to specific hardware synths, DJ software, and DAW sessions.

HOW TO MAP?

Open [HANGAR](#) in your browser and connect ZONA via USB. Press the button 'Connect to ZONA' in the top right corner. Select, arrange, and resize elements directly on the virtual surface inside the SANDBOX panel, then assign your preferred MIDI CCs, channels, and styles to each section before storing the finished layout to the module.
